

100% C...NC The project “100% C...NC - prototypes for the immediate production of customized furniture” took place in the summer term 1996 in co-operation with the Technology Centre for the Woodprocessing Industry, Lemgo. The project group’s goal was to develop virtual furniture which could be manufactured in a decentralised way on CNC-standard machines of the kind that are already increasingly used in the cabinet-makers’ and joiners’ workshops. Ideally at 100%! In addition, the virtual furniture should not only use the potentials of CNC-manufacturing, but also express the latter in their design.

Prototypes of the furniture developed within the framework of this project were presented at the professional conference “Creativity & Technology” in Hamm in November 1996.
