

Frame-Shelf

The loose sides and shelves of the Frame-Shelf are held together and stabilised by a closed frame out of solid wood. At the corners the framing timbers are joined by means of decorative wood joints. The joints are executed in such a way, that they can be put together and taken apart at any time without the use of tools. The sides and shelves can be made out of board material, like MDF, or out of solid wood.

The Frame-Shelf that was designed by Jochen Gros is manufactured under license and distributed by

→NEWCRAFT.
